

From an idea to a designed space.

Manara is an AI-powered architectural and interior design workspace. It helps a user shape a floor plan, visualize it as a polished 3D render and interactive model, and develop the interior direction as a complete AI design concept.

01

Floor Plans

Generate a new layout or upload a reference, then refine the plan through written design requests.

02

3D Renders

Transform a floor plan into styled isometric visuals and an interactive 3D model.

03

AI Designs

Build an interior concept from the room type, style, palette, requirements, budget, and atmosphere - with visual and written specifications.

THE CONNECTED WORKFLOW

One project can move through all three Studio tools.

Plan

Create or refine the spatial layout.

Visualize

Generate styled 3D renders and a model.

Design

Define the interior look, materials and furniture.

Floor Plans

The Floor Plan Studio turns a brief or reference image into a usable visual layout, then lets the user keep improving it conversationally.

- Generate from requirements: choose the building type, size or bedroom scale, and presentation style, then describe the desired layout.
- Work from a reference: upload an existing plan or image as the starting point.
- Revise with natural language: request changes to the generated layout without restarting the project.
- Preserve project rules: carry floor-plan guardrails and requirements into later stages.
- Export and continue: download the result or send the approved plan directly into the 3D workflow.

3D Renders

The 3D Studio converts a floor plan into a realistic architectural visualization, with style variants, iterative refinement, and a true interactive model.

- Plan-to-render generation: upload a floor plan and create an isometric, dollhouse-style interior render with depth and volume.
- Style variants: generate and switch between visual directions while keeping the plan as the structural source.
- Targeted refinement: use presets or written instructions to correct wall alignment, room proportions, circulation, structure, or styling.
- Compare and iterate: review versions and compare the source plan with the generated result.
- Interactive 3D conversion: convert the render into a model that can be rotated, zoomed, panned, viewed from preset angles, and inspected with viewer controls.
- Download deliverables: save the rendered image and export the 3D model as a GLB file.

AI Designs

The AI Design Studio creates a complete interior direction - not only an inspiration image. It combines the visual concept with the design information needed to understand and refine it.

- Define the space: select the room type, interior style, and color palette.
- Describe the brief: enter the functional and aesthetic requirements in plain language.
- Add practical constraints: refine the concept with budget range, style preference, lighting mood, and color preference.
- Generate the concept: receive a composed AI design image tailored to the selected direction.
- Receive design intelligence: the result can include a design narrative, mood and feeling, color palette, material recommendations, furniture and hero pieces.
- Refine selectively: regenerate the whole concept or focus a revision on a specific element while preserving the overall composition.
- Save and export: revisit design history, download the image, and export the design as a PDF.

**Manara compresses the early design process
into one workspace:
plan the space, see it in 3D, and define how it
should feel.**
